

ABSTRACT OF THE DISCLOSURE

A virtualized network that provides real-to-virtual correspondence without technically designed artificial systems of any kind. The virtualized network includes a plurality of virtualized entities (VENTs), each VENT a program together with its corresponding real entity contained in the real world and exactly mimicking the action of its real entity counterpart. All hardware and software devices, as well as people can be virtualized in the virtualized network. Once virtualized, persons and devices (real world entities) are able to communicate immediately and directly.
